BEYOND MOTION
THE MOST TRUSTED MOTION CAPTURE ECOSYSTEM, INSPIRED BY YOU

Nexus is the most powerful all-inclusive modeling and processing tool for movement analysis on the market. Created specifically for the whole life sciences community, Nexus delivers precise, repeatable and clinically validated data.

With more than 90% of our product enhancements driven by customer feedback, Nexus 2.10 is the latest version of our most trusted motion capture software.

Learn more about the new features and benefits of Nexus 2.10, together with some insights from Dr. Fabien LeBoeuf (Nantes Hospital, France and Research associate, University of Salford, UK) on the latest developments in Conventional Gait Modeling.
WHO IS NEXUS FOR?

GAIT ANALYSIS & REHABILITATION
- Doctors & surgeons
- Clinical scientists
- Postgrad research
- Undergrad teaching
- Military
- Physiotherapists

ANIMAL SCIENCE
- Veterinary doctors
- Researchers
- Trainers
- Postgrad research
- Undergrad teaching

NEUROSCIENCE & MOTOR CONTROL
- Clinical scientists
- Doctors & surgeons
- Postgrad research
- Undergrad teaching
- Physiotherapists

SPORTS PERFORMANCE & BIOMECHANICS
- Performance analysts
- Commercial research
- Strength & conditioning
- Postgrad research
- Undergrad teaching
- Physiotherapists
- Coaches or trainers
Nexus sets a standard for motion capture. With a host of new automated features, intelligent processing, flexible controls, and Vicon IMU integration; Nexus enables you to focus on the research, not the software.

Often when a system becomes so advanced, it can be difficult and time-consuming to use. Nexus may be Vicon’s most advanced data capture software, but that doesn’t mean it is complicated to use.

– Customize your workflow to save time by automating common processing tasks.
– Create a series of steps with the Biomechanics Workflow Builder to combine data collection and offline processing, making it simple to get started with the SCoRE and SARA Functional Calibration.
– Use offline Python/MATLAB capabilities.
– Review labeling quality and automatically detect and fill gaps.
– Manage your data via Vicon’s database management tool, ProEclipse.

Poor quality, inconsistent data can have a severe impact on decision-making. You need precise and repeatable results from high-quality, clinically validated data.

– Four times more research papers on CGM than any other model*
– Real-time data stream
– Precise and repeatable data capture
– Camera calibration feedback helps to achieve consistent calibrations in the lab, to maintain data standards.

Capturing the data is just the first step. Modeling is where the real analysis can begin. Modeling should be intelligent and advanced, designed specifically for life sciences.

– Powerful native and compatible modeling, you can process data using scripts created in Vicon BodyBuilder, Python, MATLAB, and Vicon ProCalc.
– Automated labeling
– Real-time calibration feedback
– Native PiG and CGM2 – can run concurrently to compare datasets

90% of our life sciences software enhancements are from customer feedback.
UPDATING THE CONVENTIONAL GAIT MODEL FOR THE MODERN WORLD

“The CGM2 project aims to address the limitations of the CGM while maintaining its strengths”

Dr. Fabien LeBoeuf

Plug-in Gait v CGM2 Kinematics (Left context only displayed)
**OPEN SOURCE FOR GREATER CONTROL**

Dr. LeBoeuf’s research concentrated on extensive investigations on the localization of the hip joint center (HJC) in order to evaluate its impact on kinematics and kinetic CGM outputs. Previously, no study had investigated the effect of HJC mislocation, because the CGM had been implemented in a proprietary commercial package that could not be modified.

CGM2 allows you to modify either the geometry of CGM or its kinematic and kinetic processing. Nexus provides direct native pipeline integration to process your CGM2 data using scripts created in Python, MATLAB and Vicon ProCalc. Nexus meets the modeling needs to enable the comprehensive integration of research pipelines and is equally suitable for quick in-class tuition. It is the most robust, repeatable and reliable real-time labeling and skeletal solving solution available for biomechanics.
WHAT CAN YOU DO WITH NEXUS?

MANAGE & PREPARE YOUR SYSTEM

Easily calibrate and configure the system. Seamlessly connect devices via the Vicon Control app. Prepare subjects by creating subject templates, calibrating labeling skeleton templates, creating pipelines, to increase the speed and accuracy of processing data.

The data-processing engine automatically initializes the labeling of your subject, removing the need to label manually. Nexus can automatically detect gaps and display information about labeling quality, enabling quick data correction if needed.

Nexus enables you to capture muscle activity and movement, review trials, assess foot strikes and review data quality. The system identifies events and fills gaps in your data.

Perform modeling, using PiG or CGM2 to derive kinematics and kinetics, or Oxford Foot Model for kinematics. Input subject measurements for PiG or full body analysis. Working with inertial sensors, you can capture, manage, import and export IMU data. Process digital video files and export trial data with 3D video overlay, ASCII or C3D.

AUTOMATE PROCESSING OPERATIONS

Save time with highly customizable, automated processing operations. You can review your processing history and quickly pull off reports. Create custom pipelines for common processing tasks.

With direct native pipeline integration, you can process data using scripts created in Vicon BodyBuilder, Python, MATLAB and Vicon ProCalc.
NEXUS 2.10
SEAMLESS INTEGRATION
Nexus 2.10 can seamlessly integrate with Vicon’s market-leading IMU, Blue Trident, via its wireless network device, Beacon. By adding inertial sensors into the optical world, you can collect synchronized optical and inertial data in one platform.

HARD SYNC
Precise timing of inertial to optical data.

QUATERNIONS
When combining Blue Trident with Nexus you can describe global joint angles with three-dimensional orientation and rotation.

TOBI EYE TRACKER INTEGRATION
Tobii’s latest eye tracker is integrated into Nexus 2.10, enabling streaming of synchronized eye-gaze tracking with optical data.

OPEN SOUND CONTROL INTEGRATION
Open Sound Control is the protocol for communication among computer and sound synthesizers for networking technology. Nexus now provides options for streaming data in OSC format, enabling live synchronized or offline. Data can be accessed by any platform that supports OSC for real-time control of sound and other media processing.
